Nasapp by Eurecat

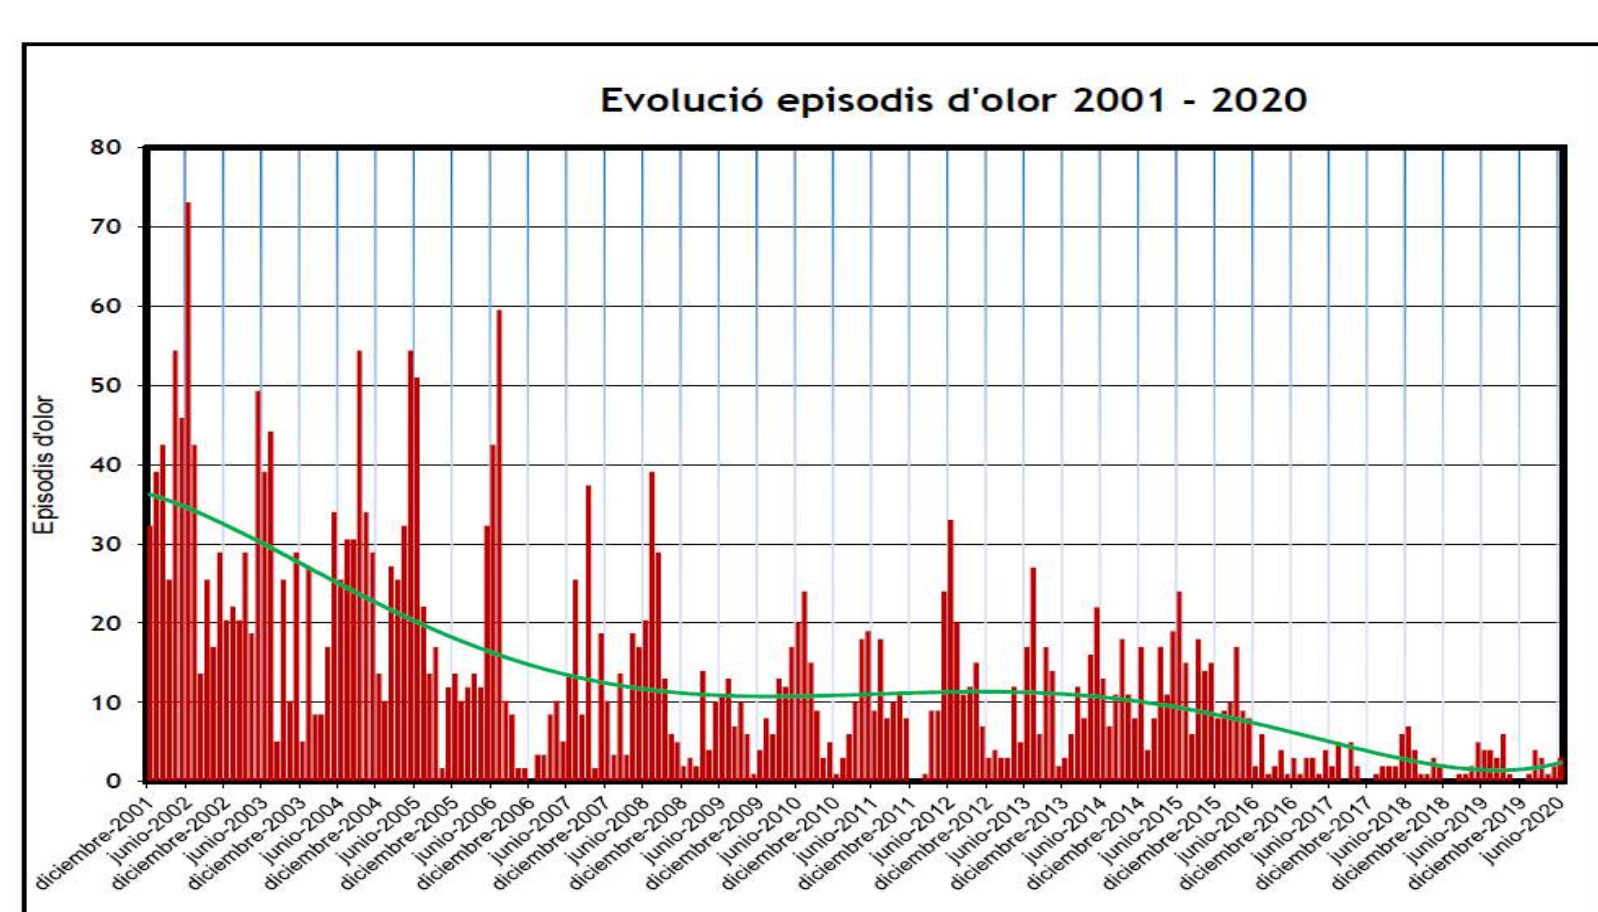

NasApp is an odour monitoring and management platform that relies on citizen participation as an early warning trigger.

The system also considers unfavourable weather conditions, allows you to set alerts, can be used to predict episodes and helps to establish the causes of specific outbreaks in certain activities.

Thanks to the NasApp system, the episodes of bad smells have been reduced by 80%

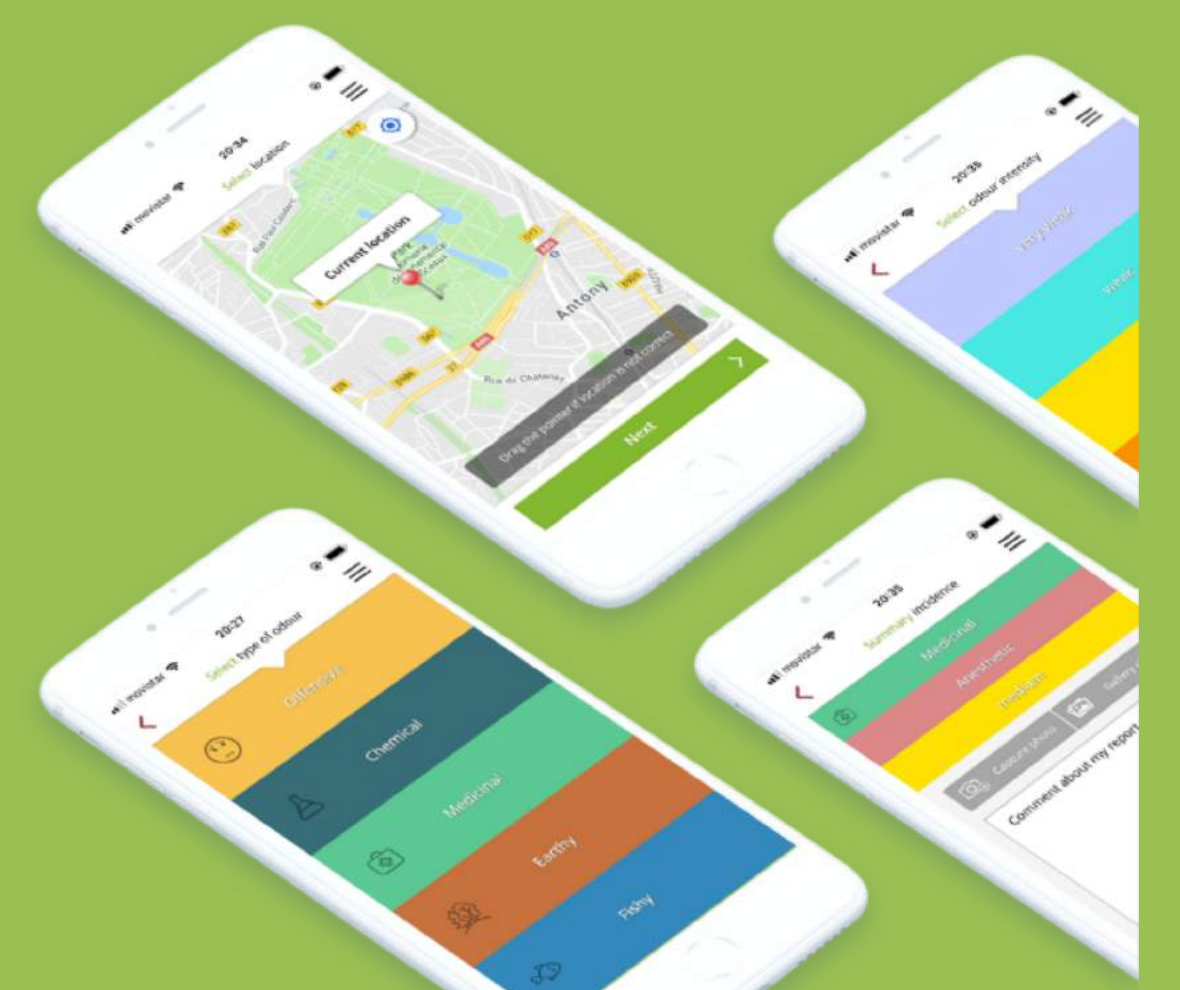

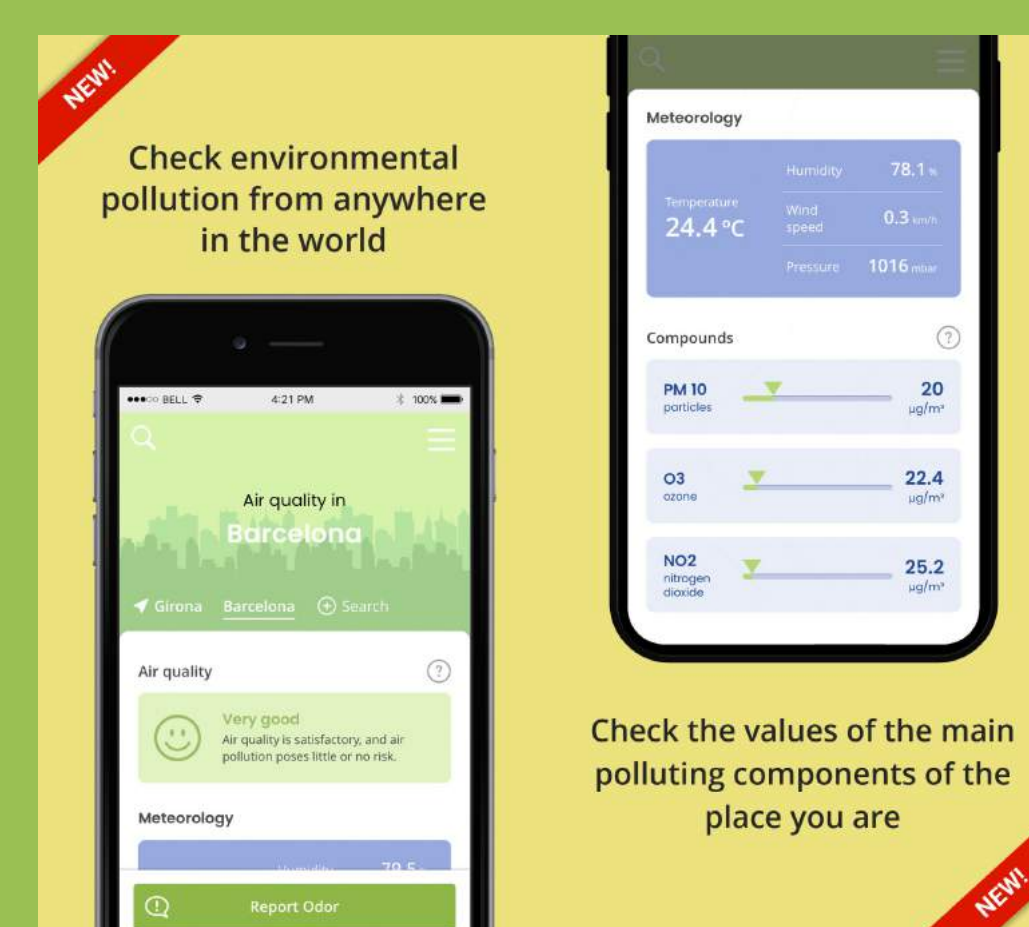

Digital platform for detecting and managing odour episodes

It transforms citizen complaints and observations into a powerful odour impact monitoring system and generates odour maps.

It allows qualitatively quantifying air quality regardless of the type of odors, making a complaint visible and providing a place to consult environmental information

Complaints and observations tracking technology for odour episodes
